SUMMARY

DevSecOps and cloud security engineer with a software engineering foundation and production experience building secure CI/CD pipelines, infrastructure-as-code, and multi-tenant cloud systems on Microsoft Azure. Solo-built and deployed SecureObs, a security SaaS that unifies seven scanners with cross-tool deduplication, CI/CD build gating, and credential-free IaC attack-path analysis. Builds security into the SDLC behind policy gates, with least-privilege access, secrets management via Managed Identity and Key Vault, and a defense-in-depth, secure-by-design approach. Pursuing an MS in Cybersecurity (Information Security) at Georgia Tech.

TECHNICAL SKILLS

Cloud & Cloud Security: Microsoft Azure (App Service, Static Web Apps, Container Instances, Key Vault, Managed Identities, Entra ID, VNet, private networking, PostgreSQL Flexible Server, Log Analytics / App Insights); Entra ID OAuth 2.1 / PKCE; PostgreSQL row-level security; defense-in-depth network design

IaC & Automation: Terraform (cloud-agnostic IaC), HCL static analysis, pipeline-as-code (YAML), GitHub Apps, ephemeral sandboxed runners, configuration governance

DevSecOps & CI/CD: Azure DevOps (Server & Services), GitHub Actions, Docker, Kubernetes; secure CI/CD with build gates; SARIF; OpenTelemetry; automated release and artifact management

Application & Software Security: SAST (Semgrep, Bandit, ESLint-security), DAST (OWASP ZAP), secrets detection (Gitleaks), SCA (Trivy, OSV-Scanner), IaC scanning (Checkov, Trivy); secure SDLC; RBAC / IAM; threat modeling; OWASP / CWE

Languages: C# / .NET, Python, Go, PowerShell, TypeScript / JavaScript, Bash, SQL

Architecture & Practices: Clean Architecture, domain-driven design, REST API design, multi-tenancy and tenant isolation, least privilege, secure-by-design

PROFESSIONAL EXPERIENCE

Genetec Inc. Montreal, QC (Hybrid)

Platform Engineer, Software Configuration Management & Tools (Engineering Efficiency) May 2026 - Present

- Administer and secure the R&D application lifecycle management platform (Azure DevOps Server / Services and GitHub) for engineering teams, enforcing secure configurations, branch and pipeline policies, and access governance across shared source-control and build systems.
- Build and maintain internal tooling and libraries in C#, Go, and PowerShell that automate configuration, governance, and reporting across shared developer applications, reducing manual toil and standardizing secure-by-default settings.
- Design, configure, and maintain build and release pipelines with conditional gates and environment promotion logic, and provision supporting infrastructure as code with Terraform on Azure.
- Develop data export and reporting tooling that surfaces configuration, compliance, and pipeline health across teams to support governance decisions.

SES & Technologies Ltd. Laval, QC

Full-Stack Developer, DevSecOps June 2025 - May 2026

- Built and integrated a DevSecOps toolchain into Azure DevOps pipelines (Semgrep for SAST, OWASP ZAP for DAST, GitLeaks for secrets), containerized with Docker, with gates that block promotion on high-severity findings.
- Designed and implemented RBAC / IAM from scratch across enterprise applications: authentication flows, role and permission scoping, and access-group management, delivered through an Angular and NgRx administration panel.
- Architected and delivered .NET backend services and REST APIs following Clean Architecture, domain-driven design, CQRS, and Repository patterns, plus Angular frontends, across the full SDLC.
- Engineered pipeline-as-code (YAML) build, test, and release stages with conditional gates and environment promotion across multi-repository codebases.

Genetec Inc. Montreal, QC

Software Developer Intern, AutoVu Dec 2023 - May 2024

- Delivered backend services in .NET and C# for the AutoVu platform, a system serving law-enforcement agencies handling sensitive data, contributing bug fixes and feature work across the product lifecycle.

- Integrated REST and SignalR APIs for real-time communication in a microservices ecosystem; wrote unit and integration tests to reduce regression risk ahead of releases in a security-critical environment.

Matrox Graphics Inc. Dorval, QC

Applications Engineer Intern May 2023 - Sep 2023

- Built diagnostic automation tooling in Python and C# to surface misconfigurations, insecure defaults, and overly permissive access settings in customer deployments, improving time-to-resolution by 55 to 65% for enterprise support cases.
- Performed configuration audits and log analysis to identify root causes and security gaps; authored hardening recommendations and standardized triage documentation across support teams.

KEY PROJECTS

SecureObs - DevSecOps Security Observatory Platform secureobs.com · [source](#)

.NET 8 Clean Architecture · *Angular 21* · *PostgreSQL 16 (RLS)* · *Azure* · *Terraform* · *Docker* · *Python* · *Go*

- Solo-designed and built a production-deployed, multi-tenant security SaaS that unifies seven open-source scanners (Semgrep, Gitleaks, Trivy, Bandit, ESLint-security, OSV-Scanner, Checkov) into one triage dashboard, with cross-tool canonical deduplication, SARIF export, and a CI/CD build gate that fails pipelines on unresolved blocking findings.
- Built a credential-free Infrastructure-as-Code attack-path engine that statically parses Terraform (no terraform plan, no cloud credentials), constructs a typed Azure resource graph, and chains misconfigurations into ranked attack paths via a pluggable rule engine, visualized interactively in-app with Cytoscape.
- Enforced defense-in-depth tenant isolation: application-layer authorization combined with PostgreSQL FORCE row-level security under a restricted non-owner database role, validated by Testcontainers regression tests.
- Engineered zero-config managed integrations (GitHub App connectors, Terraform-root discovery, auto-generated pipeline PRs) that execute scans in ephemeral, sandboxed Azure Container Instances using short-lived tokens and auto-provisioned, project-scoped API keys.
- Secured the platform with Entra ID OAuth 2.1 (PKCE) and SHA-256-hashed API keys, with all secrets in Azure Key Vault via Managed Identity; instrumented with OpenTelemetry, security headers, and layered rate limiting, and shipped self-verifying end-to-end canaries (OWASP WebGoat) behind an automated multi-tag release train.

Security Tooling Portfolio - Python Microservices

*Python 3.12 + FastAPI · PostgreSQL · Celery + Redis · Docker · Kubernetes
· Terraform*

- Built three independent microservices (vulnerability scanner, security assessment orchestrator, network traffic analyzer) with async job processing (Celery + Redis), Pydantic-validated REST APIs, and Kubernetes deployment objects (NetworkPolicies, HPA, PDB).

Cloud Security Labs & Write-ups - github.com/jasonachkar/cybersecurity-writeups

- Hands-on Azure Firewall and Terraform network-isolation labs documenting secure landing-zone patterns, with technical write-ups.

EDUCATION & CERTIFICATIONS

Georgia Institute of Technology Online

Master of Science in Cybersecurity, Information Security Specialization (In Progress, 2026 to 2028)

Focus: secure software development, identity and access management, network security and intrusion detection, applied cryptography, software vulnerability analysis.

Concordia University Montreal, QC

Bachelor of Computer Science April 2025

Focus: software architecture, computer networks, database systems, secure software development, operating systems.

Certifications: CompTIA Security+ · SC-500: Microsoft Cloud & AI Security Engineer (In Progress) · Microsoft Azure Fundamentals (AZ-900) · Google Cybersecurity Professional Certificate
